

General Workflow for Running R

- Clearly define the goal of the study – This is done before starting R
 - What is your objective
 - What tests are you going to use
 - What data you have or plan to collect/compile
 - Where is the Data Stored and in what format
 - How do you plan to summarize your results
- Implement the analysis using R tools
 - Which libraries do you need
 - Are the data you have in the correct format? – If not how to make it compatible
- How do you want to use R
 - Can R Commander help? At least to get started?
 - Syntax help – Gen AI, Web Search (be careful – Use a dummy example to learn)
- How do you want to save results?
